BAIRD / ZORAASI · RESEARCH ARCHIVE · EDITION 2026.10.22

A Theory of Everything Updated research corpus

Exact mode sums, coupled vacuum, radion mixing and finite-momentum stability

Prepared for Christopher Michael Baird
AI-assisted curation and editorial assembly

Reading edition	New material	Preserved baseline
9,447 pages	51 source PDFs / 189 pages	9,252 pages from the published 2026.10.20 edition

Current result to read first

The minimal retained spectral action has tachyonic poles with negative residues and additional non-real poles under the specified direct Lorentzian continuation. Earlier positive static curvatures and two-derivative kinetic tests do not establish a stable vacuum. The new corpus makes that qualification visible before the historical material.

How to navigate

Pages 1-6: update guide and catalogue.
Pages 7-96: nine theory and continuation notes.
Pages 97-9348: complete prior public corpus.
Pages 9349-9447: recent computational mathematics and status records.

The package retains original research files, all seven GitHub prerelease bundles, complete caveats, source hashes and portable assembly tools. The prior public ZIP remains intact as an archival component.

Local preparation only. No new Zenodo DOI or publication is created by this package.

What the latest work establishes

Read the sequence as a record of conditional results and corrections. The source PDFs retain their historical wording; this guide identifies their present scope.

Stage	Current interpretation
Common stationary profiles	Finite local spectral data do not select a unique exact gauge response for every allowed profile family. This is an existence result, not ambiguity for every prescribed dataset.
Weak, neutral and scalar completion	Geometric weak response and neutral matching are followed by a declared microscopic scalar/anomaly sector. Its local scalar estimates are subsequently replaced by exact internal mode-sum calculations within the retained model.
Exact coupled vacuum	The untuned action is unstable. Selected mass and flatness terms yield restricted tuned branches with positive static curvatures. Those inputs are not predictions or a solution of the cosmological constant problem.
Radion and finite momentum	The two-derivative metric is positive in the tested fixtures. The later full-momentum quadratic operator exposes tachyonic and complex poles. The representative radion-connected squared parameter shifts from about 0.8296 to 0.6565 in cutoff units; it is not a certified particle of a completed theory.

Limits that remain active

The finite-momentum calculation uses the declared warped family, a closed neutral scalar/metric sector and the transverse-traceless graviton. Charged/phase constraints, higher compactification modes and tadpoles, additional allowed operators and a causal quantum prescription remain unresolved. Bounded floating-point pole searches are not global or interval certificates.

No measured coupling is fitted. The measured fine-structure constant remains unexplained. Neither the archived calculations nor this packaging establish a completed or experimentally validated Theory of Everything.

The full release notes and extracted assumptions/review records are included in the archive. See CLAIM_STATUS.md for a more detailed supersession map.

Theory and continuation catalogue

Physical page numbers below refer to this 9,447-page reading edition. IDs map to original filenames, hashes and sources in CATALOG_NEW_WORK.json and CATALOG_NEW_WORK.csv.

ID	Work	Pages
N001	Six-route research continuation	7-19
N002	Common-vacuum spectral-profile theorem	20-26
N003	Geometric weak-gauge response	27-38
N004	Neutral gauge and Higgs matching	39-49
N005	Microscopic scalar and anomaly sector	50-62
N006	Exact scalar mode sums and Higgs kinetics	63-73
N007	Exact coupled scalar/radius vacuum	74-80
N008	Radion kinetics and scalar mixing	81-88
N009	Finite-momentum metric/radion/scalar poles	89-96

Source status

N001, N002 and N005-N009 are published GitHub research prereleases. Their 26 original assets, metadata and release descriptions are retained. N003 and N004 are recovered local PDF notes; standalone code bundles for those two notes were not located.

The 21 October checkpoint includes shared-action, thermal, public-count, electromagnetic, ultraviolet and synthetic-memory routes. Its public experimental data reanalysis is distinct from the original authors' work; the synthetic-memory exercise is not an experience measurement.

The chronology is scientific, not a claim that every note has the same publication date. The finite-momentum release was published on 23 October UTC / 22 October America/New_York. Its preparation date remains 22 October.

Mathematics and status catalogue / 1

Forty-two distinct PDFs cover fourteen finite Hadamard orders. Reports and status boards are retained as archive records; no matrices are independently recalculated in this edition.

ID	Date / order	Record	Pages
N010	Oct 21 / 15100	Construction report	9349-9354
N011	Oct 21 / 15100	Scoreboard	9355-9355
N012	Oct 21 / 15100	Status board	9356-9356
N013	Oct 21 / 15108	Construction report	9357-9360
N014	Oct 21 / 15108	Scoreboard	9361-9361
N015	Oct 21 / 15108	Status board	9362-9362
N016	Oct 21 / 15124	Construction report	9363-9368
N017	Oct 21 / 15124	Scoreboard	9369-9369
N018	Oct 21 / 15124	Status board	9370-9370
N019	Oct 21 / 15132	Construction report	9371-9374
N020	Oct 21 / 15132	Scoreboard	9375-9375
N021	Oct 21 / 15132	Status board	9376-9376
N022	Oct 21 / 15140	Construction report	9377-9380
N023	Oct 21 / 15140	Scoreboard	9381-9381
N024	Oct 21 / 15140	Status board	9382-9382
N025	Oct 21 / 15148	Construction report	9383-9388
N026	Oct 21 / 15148	Scoreboard	9389-9389
N027	Oct 21 / 15148	Status board	9390-9390
N028	Oct 21 / 15156	Construction report	9391-9397
N029	Oct 21 / 15156	Scoreboard	9398-9398
N030	Oct 21 / 15156	Status board	9399-9399

Byte-identical PDF copies are removed; distinct historical status snapshots remain. Available JSON, text and Markdown sidecars are included with their provenance. Full-conjecture, new-order and physical-validation claims are not inferred from these reports.

Package, provenance and reuse

Reproducibility

The public ZIP contains the updated reading corpus, this guide, catalogues and page maps; the original 2026.10.20 package; all seven later release distributions; the two intervening PDFs; recent mathematics records; complete caveats; prepared Zenodo metadata; and assembly/verification tools.

Run `python3 08_Rebuild/verify_package.py` from the extracted root, or use the SHA256SUMS.txt manifest. Rebuild the reading PDF with `08_Rebuild/rebuild_corpus.py` and an output path outside the package. Each research bundle retains its own scientific reproduction instructions.

Verification boundary

Source checksums, ZIP integrity, PDF syntax, page content/geometry, navigation and a fresh portable rebuild are checked during packaging. The final VERIFICATION.json records the executed checks and the visual sample. Scientific suites are not rerun, and their recorded checks are not summed as independent physical evidence.

Lineage and attribution

Previous public edition: 10.5281/zenodo.23524358.
Existing concept: 10.5281/zenodo.14019809.
Latest included GitHub tag: v2026.10.22-finite-momentum-poles.
Pinned source: c0e36ad13a8da384c2b8c25463dae01022c12e46.

The historical corpus retains Jennifer Lorraine Nielsen's separately authored 116-page CC BY 4.0 preprint (10.20944/preprints202604.0315.v5). The private 240-page manuscript and personal study guide remain excluded. The public-count input is separately attributed to Pedalino et al. (10.5281/zenodo.17502163); the optional EOS ancillary table is not redistributed.

Component licenses and printed authorship remain authoritative. Inclusion does not imply collaborators' endorsement or joint authorship of every work. See RIGHTS_AND_ATTRIBUTION.txt and each preserved bundle. AI-assisted assembly does not constitute external peer review.

Coverage

This edition covers the verified public baseline, the seven identified prereleases and the documented recent local sources. It does not claim to contain every cloud-only draft or repository. Full research limitations are preserved in the source notes, release descriptions, CLAIM_STATUS.md and 07_Caveats/.
